

## Senior Tech Lead for Logistics StartUp

Hi!

We are a young but well funded startup in the field of logistics and we're looking for a senior tech lead.

Just as having a CEO who will pick up the phone with a customer or a COO who will run to the warehouse and find the right palette, we are looking for someone who brings the experience of managing dev teams, but is not afraid of actually writing code if necessary. Our core team is in their late 30's and early 40's so we all have significant experience to build on and you fit in well if you do too. Money will not be the obstacle and we work 90% remote.

To give a better understanding of the professional profile, we believe that this should describe you:

Graduated in the fields of electronics, communications or software engineering, or equivalent experience / qualification

Professional experience in:

- hardware and embedded system engineering
- sensor data and signal processing and communications engineering
- Coding skills in C, C++, C#
- Experience in requirements management

Solid knowledge in:

- web technologies and front end development
- client-server communication and cloud technologies

Multiple years of experience in electronics

Great english skills, german or russian is a plus

If you're up for this let's talk and see if our mission motivates you to join!

Cheers,  
Oliver
